

Cybersecurity Training Diary

Day 18: Threat Intelligence & Threat Hunting

1. Topics Covered

✓ Threat Intelligence Types

Type	Audience	Example
Strategic	Executives	Cybercrime trend reports
Tactical	SOC Analysts	IOC feeds (IPs, hashes)
Technical	Incident Responders	Malware analysis reports
Operational	Threat Hunters	TTPs (Tactics, Techniques, Procedures)

✓ Threat Hunting Methodology

```
graph LR
  A[Hypothesis] --> B[Data Collection]
  B --> C[Analysis]
  C --> D[Validation]
  D --> E[Documentation]
```

✓ Common Threat Intelligence Sources

- **Open Source:** [MISP](#), [AlienVault OTX](#)
- **Commercial:** Recorded Future, ThreatConnect
- **Government:** [CISA AIS](#), [MITRE ATT&CK](#)

2. Key Takeaways

✓ IOCs vs TTPs:

- IOCs (Indicators of Compromise) are reactive (known bad IPs/hashes)
- TTPs are proactive (attack patterns to hunt for)
- ✓ **Pyramid of Pain:** The higher you detect (Tools > TTPs), the harder for attackers to evade
- ✓ **Threat Intel must be actionable** - filter irrelevant data

3. Practical Exercises

♦ Exercise 1: Analyze IOCs

```
# Query VirusTotal API
import vt
client = vt.Client("<API_KEY>")
file = client.get_object("/files/275a021...")
print(file.last_analysis_stats) # Detection ratio
```

♦ Exercise 2: Hunt for Lateral Movement

```
# Splunk query for PSEXEC usage
index=wineventlog EventCode=4688 Process="*psexec*"
| stats count by host, user
```

4. Questions for Reflection

- ? Why is sharing threat intelligence important?
- ? How could AI improve threat hunting?
